KSign Product Key Full Free

kSign is a free tool for signing applications using genuine Comodo certificates, with the aim of getting rid of the "Unknown Publisher" message that appears when trying to install or run them. It's wrapped in a simple interface, where you can create a list with multiple files to sign all of them at the same time. Folders containing multiple files can be added too.

What's New in the KSign?

kSign allows you to apply Comodo certificates to any file (or folder) to get rid of the "Unknown Publisher" warning that appears when trying to install or run it. kSign supports a wide range of file formats, enabling you to sign: - Java applets, either 32-bit and 64-bit (.jar files) - Mozilla object files (.xul files) - Windows drivers (.sys files) - Adobe Air tools (.air files) - Microsoft Office Macro or VBA files (.mso files) - Silverlight applications (.xap files) - XAF files (.xaf files) - 32-bit and 64-bit executable files (.exe,.dll,.ocx,.msi,.cab) - 32-bit and 64-bit DLLs (.dll,.ocx,.msi,.cab) - 32-bit and 64-bit OCXs (.ocx) - 32-bit and 64-bit plugins (.pdb files) Unlike the "Not Signed" or "Unknown Publisher" warnings, kSign displays the content of the file you're trying to install or run with the signature. If you encounter any problems or would like to report a bug, visit the link below: Requirements: 1) Comodo certificate file, in PFX format (or a PEM certificate file). Download it for free from the Signing Certification section at Comodo's site. 2) An installation of "kSign" can be obtained at 3) A folder with the Comodo digital signature, containing the files to sign. 4) A folder with the Comodo digital signature, containing the files to sign. 5) This folder will be used by kSign to perform the signature process. Known issues: 1) Currently, the program doesn't offer an uninstall functionality, but you can delete the directory the signed files will be stored in (usually C:\Users\User\AppData\Roaming\kSign\kSignCache). 2) The version available here doesn't support signed XAP files, unless you buy the XAP certificate from Comodo. 3) The program doesn't support

System Requirements For KSign:

Minimum: OS: Windows XP, Vista, or Windows 7 Processor: 2.0 GHz Core 2 Duo, AMD Athlon Dual Core, Intel Pentium D
Memory: 2 GB RAM Graphics: 1024 MB dedicated video memory (1024 x 768) Hard Drive: 10 GB free space Additional
Requirements: Internet Connection Browsers: Google Chrome, Firefox, Internet Explorer 9 or higher, Safari, Opera, or any
other supported browser Software needed to complete the install and
