has built-in networking, which was initially used in late 2001 as a standard method of communication between apps. This was moved to a new framework, e2, which was in wide use until 2013. History AutoCAD was originally an add-on product for the office automation products of Ashton-Tate. The first release of AutoCAD appeared in March 1984. The development of the software was transferred to a company called Argent Systems in July 1984. A year later, Argent Systems merged with the competing product, MicroStation, when the AutoCAD technology was licensed to a new company called MicroTechniques. In 1987, Autodesk announced AutoCAD as the company's own product. was an "add-on" product, where the word "add-on" is used to refer to an application that is installed with a given product and usually requires the original product to be installed in order for the add-on to work. This was changed with AutoCAD 2, which removed the "add-on" model and made AutoCAD (and all other Autodesk products) freeware. AutoCAD was originally made available as a graphic-oriented application, but was later updated to have a user interface very similar to the windows-oriented software products, such as Microsoft Word, Excel and Visual Basic for Applications (VBA). Although still available as a stand-alone product, it was later made available in a Windows environment. In 1985, an application was released called AutoCAD/MAP which was a GIS-oriented software package that allowed the user to input coordinates in the drawing. After the introduction of GIS software, AutoCAD/MAP was later renamed AutoCAD Map. AutoCAD Map is still available today and is the preferred method to input coordinates. AutoCAD was first released for the Intel 80286 platform, and has since been ported to many other platforms, including the Intel x86, 80386, Pentium, and Pentium Pro, Microsoft Windows 3.x and later, Unix, Linux, OS/2, OS X, and the PowerPC. The first version of AutoCAD on DOS was named "AutoCAD 80", and was available only for the Intel 80286 platform. AutoCAD for Linux was started in September 1999 and made available in March 2000 for the first version of Red Hat Linux. AutoCAD for OS X was first released for OS X 10. ca3bfb1094

Field of the Invention The present invention relates to a fiber-optic light source unit, more specifically to a fiber-optic light source unit comprising a plurality of fiber-optic elements each emitting a divergent light beam, a dispersing optical system for directing the divergent light beams emitted by the fiber-optic elements to a predetermined direction, and a collimating optical system for collimating the divergent light beams emitted by the fiber-optic elements to a parallel light beam. 2. Description of the Related Art Fiber-optic light source units are well known in the art. They are used as illuminators for electronic endoscopes for examining cavities in the human body, e.g. the lungs, stomach, or intestines. The fiber-optic light source units of this type comprise a light source, a fiber-optic bundle that bundles the emitted light, and a dispersing optical system for directing the divergent light beams emitted by the fiber-optic bundle to a predetermined direction. The light source can be a light-emitting diode, an LED, a super luminescent di

Wireframe: Make the drawing process more efficient by creating a set of layouts, including detailed interiors, before you start to build your model. Export wireframes in DXF format and set up an e-mail-link in the drawing to send them to other stakeholders. Design Construction: Add 3D in the last step of your design process and deliver your 3D model in DXF format to external design tools. Use AutoCAD as the configuration and rendering tool for rendering of your 3D model.Q: Symphony - Data-Transformer - issue with nested array field My entity have a nested field, and using Doctrine as ORM. want to change the field to an array, but I got strange results, and I would like to know what I'm doing wrong. I got an entity with a nested array field: class MyEntity { private \$data; public function setData(array \$data) { \$this->data = \$data; } public function getData() { return \$this->data; } } And the Symfony Data-Transformer make me the following change: class MyEntityTransformer extends DataTransformerInterface { private \$doctrine; public function \_\_construct(\$doctrine) { \$this->doctrine = \$doctrine; } public function transform(\$entity) { return \$entity->getData(); } public function reverseTransform(\$entity) { return [ 'data' => \$entity->getData() ]; } } If I create an instance of the MyEntity and then I try to get the value of the field 'data' I got the value of the 'data' in the entity, not in the array: \$myEntity = new MyEntity(); \$myEntity->setData
