To compare the efficacy of a new laser technique, microhysteroscopy, with operative hysteroscopy in the treatment of posthysterectomy adhesions. Randomized trial. University research center. One hundred eighteen patients with posthysterectomy adhesions. Intrauterine microhysteroscopy with simultaneous adhesiolysis with a sharp scalpel. Postoperative evaluation included the "Sickness Severity Questionnaire." A hysteroscopic examination was performed in all patients within 24 hours after surgery to evaluate the intrauterine cavity. Adhesions were treated with a microhysteroscope in 21 patients and with operative hysteroscopy in 108 patients. Postoperative pain associated with the examination and the adhesion removal. The adhesions were treated successfully in all patients who underwent microhysteroscopy. One hundred seven patients (96%) had no pain or mild pain (visual analog scale score, 0-1) after microhysteroscopy, whereas 87 (78%) patients had moderate or severe pain (visual analog scale score, 2-5) after operative hysteroscopy (P
